Project Design Phase: Problem – Solution Fit Template

Date:	30 September 2026
Team ID:	[SWTID-2026-3230]
Project Name:	Auto Ticket Classification using Flow Designer
Maximum Marks:	2 Marks

Problem – Solution Fit Canvas Details

The Problem-Solution Fit analysis below maps customer segments, jobs-to-be-done, root causes, and our automated ServiceNow Flow Designer solution as per the project template [cite: 18].

Canvas Block No.	Canvas Element	Description / Project Mapping
1	Customer Segment(s) [CS]	Students, faculty members, university staff, and IT helpdesk support agents who submit or manage support requests.
2	Jobs-to-be-done / Problems [J&P]	Submitting IT support issues quickly and ensuring they are triaged, categorized, and assigned to the right technical team without manual bottlenecks.
3	Triggers [TR]	Facing sudden technical glitches (e.g., Wi-Fi dropouts, portal login errors, software license issues) and experiencing delays in ticket resolution.
4	Emotions: Before / After [EM]	Before: Frustrated, anxious, and helpless due to slow manual ticket routing. After: Confident, relieved, and assured of rapid response and

		transparent tracking.
5	Available Solutions [AS]	Traditional manual email helpdesk, phone calls to helpdesk, or static web forms where IT staff manually read and assign tickets.
6	Customer Constraints [CC]	Limited technical vocabulary among users, lack of 24/7 manual support staff, and high volume of tickets during peak academic seasons.
7	Behaviour [BE]	Users submitting vague ticket descriptions (e.g., 'not working') or calling helpdesk repeatedly for status updates instead of tracking online.
8	Channels of Behaviour [CH]	Online: ServiceNow Service Portal, university intranet, email notifications. Offline: Campus IT walk-in helpdesk counters and phone support hotlines.
9	Problem Root Cause [RC]	Manual ticket triage creates human bottlenecks, leading to misclassification, delayed routing, and increased resolution time for urgent issues.
10	Your Solution [SL]	Auto Ticket Classification using Flow Designer: An automated ServiceNow workflow that analyzes ticket descriptions via keyword extraction, automatically assigns categories/priorities, and routes tickets instantly.
