Project Design Phase: Proposed Solution Template

Date:	30 September 2026
Team ID:	[SWTID-2026-3230]
Project Name:	Auto Ticket Classification using Flow Designer
Maximum Marks:	2 Marks

Proposed Solution Details

The proposed solution template outlines the problem statement, novelty, business model, and architectural scalability for Auto Ticket Classification using ServiceNow Flow Designer [cite: 20].

S.No.	Parameter	Description
1	Problem Statement (Problem to be solved)	IT helpdesks in universities and enterprises suffer from high volumes of support requests. Manual sorting, categorization, and routing of tickets lead to severe bottlenecks, human errors, delayed responses, and increased resolution times during peak periods.
2	Idea / Solution description	An automated IT service management (ITSM) workflow leveraging ServiceNow Flow Designer, decision tables, and NLP keyword extraction. When an incident is submitted via the Service Portal, the system automatically analyzes the short and detailed descriptions, predicts the category, sets the priority, and routes the ticket directly to the correct assignment group.
3	Novelty / Uniqueness	Integrates automated natural language text parsing directly

			inside ServiceNow Flow Designer without requiring complex external middleware. Combines dynamic decision rules with automated routing and exception-handling dashboards for seamless triage.
4		Social Impact / Customer Satisfaction	Dramatically reduces ticket resolution wait times for students and faculty, lowers administrative stress on helpdesk staff, ensures 24/7 instant triage, and provides transparent tracking to boost overall user trust and satisfaction.
5		Business Model (Revenue Model)	Designed as an enterprise SaaS operational efficiency solution. Applicable for higher education institutions and corporate IT helpdesks through subscription-based ServiceNow deployment, reducing overhead operational labor costs by up to 40%.
6		Scalability of the Solution	Built on ServiceNow's multi-tenant cloud PaaS architecture with asynchronous flow worker queues and cloud database indexing, ensuring seamless horizontal scaling during high-volume periods (such as semester beginnings and exam weeks).

Proposed Solution Workflow Architecture

The following workflow illustrates the step-by-step automated classification pipeline:

- **Step 1: Ticket Submission:** End-user submits an incident via ServiceNow Service Portal with title and description.
- **Step 2: Trigger Event:** Database insert action triggers the ServiceNow Flow Designer workflow execution engine.
- **Step 3: Automated Triage & Analysis:** Flow Designer parses text, extracts keywords, and matches against decision tables.
- **Step 4: Category & Priority Assignment:** System automatically assigns Category, Subcategory, and Priority levels.
- **Step 5: Smart Routing & Notification:** Ticket is routed to the designated Assignment Group, and confirmation emails are dispatched.
