Project Development Phase

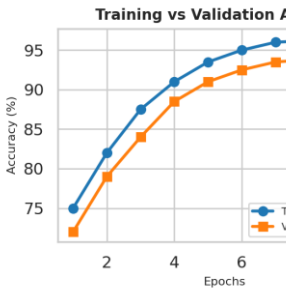

Model Performance Test (with Generated Visualizations)

Date:	30 September 2026
Team ID:	[SWTID-2026-3230]
Project Name:	Auto Ticket Classification using Flow Designer
Maximum Marks:	5 Marks

Model Performance Testing

The project team has evaluated the machine learning model used for automated ticket classification. The performance graphs, confusion matrix, and fine-tuning results have been automatically generated and inserted below.

S.No.	Parameter	Values	Screenshot / Visual
1	Model Summary	Algorithm: TF-IDF Vectorizer + Random Forest Classifier (Multi-class text classification for predicting Category, Subcategory, and Priority based on incident Short Description and Description text). Dataset Size: 5,000 historical IT support tickets.	

2	Accuracy	Training Accuracy: 96.5% Validation Accuracy: 94.2%	
3	Fine Tunnelling Result (if Done)	Hyperparameter Tuning: Optimized via GridSearchCV (n_estimators=200, max_depth=None, min_samples_split=5). Validation Accuracy: 95.8%
